Hx Present Illness/Past Medical Hx/Platelet Graft Therapy:

39 y.o. female s/p injury to right ankle. Her right ankle was injured in a work related accident and she had an open reduction, internal fixation with an external fixator placed on her right lower extremity. She was admitted to an acute care facility for a gracilis free flap to her right ankle which was not done because the donor vessels in the ankle were unacceptable. Instead, she was brought to the Center for an Autologous Platelet Graft. The platelet graft was to assist in tissue granulation with the goal to prepare the site for a skin graft. Patient was reevaluated on 06/18/01 and it was decided to postpone the skin graft at this time. The patient appears to be healing well without surgical intervention at this time .
